DIGITAL ASSETS, TOKENIZATION & PRODUCT DILIGENCE

SUMMARY

Digital asset and tokenization research professional focused on institutional product diligence, market structure, and portfolio monitoring. Founding research hire at a Web3-focused registered investment adviser, where I built the research operating system from scratch, led a four-analyst team, and supported underwriting across ~250 investments and ~\$500M in assets under management. Deep expertise in tokenized-product equivalence, stablecoins, liquidity, custody, settlement dependencies, and disclosure-driven monitoring. Seven-paper research program (four on SSRN; work submitted to the Fifth Conference on the International Roles of the U.S. Dollar, hosted by the Federal Reserve Board and Federal Reserve Bank of New York, June 2026).

EXPERIENCE

Senior Investment Analyst, Digital Assets | Borderless Capital (RIA; first hire)

Dec 2019 – Present

- Supported sourcing and underwriting across 1,000+ opportunities and ~250 investments (~\$500M AUM, ~10 institutional funds), with coverage spanning tokenized products, stablecoins, market structure, and operator risk. Led investor reporting, portfolio strategy, and committee briefing materials with trigger-based assumption tracking.
- Analyzed ~75 tokenization offerings in 2025 and invested in 18. Built automated daily multiple-on-NAV dashboard sourcing SEC filings and press releases directly. Modeled daily portfolio liquidity across holdings and token unlock schedules for committee reporting.
- Led diligence on stablecoins and tokenized products: reserve custody, redemption mechanics, settlement finality, concentration and portability risk, and the evidence required to establish legal, operational, and economic equivalence.
- Built the research operating system and monitoring workflows that investment committees rely on for diligence, sizing, and ongoing oversight: coverage roadmap, compliance workflows, decision logs with documented assumption registers, and trigger-based posture updates. Led a four-analyst team.
- Forecasted \$1B+ on-chain protocol collapse ~12 months early by mapping the causal chain and defining leading indicator thresholds; guided risk posture to avoid exposure. Prevented hostile governance capture on a top-50 Layer 1 blockchain via voting-path simulation. Identified and corrected circulating-supply misreporting that had propagated to industry-standard data aggregators.
- Built quantitative token-economic models forecasting emissions, fee capture, the transition from subsidy-funded to revenue-funded economics, and governance concentration under wide scenario ranges. Advised on 100+ tokenomics engagements across stablecoin issuers, tokenized real-world assets, and lending platforms. Uniswap Foundation governance committee (2024); led 9 accelerator programs.
- Developed the **CLII** (Control Layer Intensity Index) and **MVEP** (Minimum Viable Equivalence Pack) to evaluate tokenized products on documented evidence: rights parity, custody, finality, and stress behavior (both on SSRN). AI-assisted diligence workflow processes ~1,000+ pages per deal, reducing review time from ~4 hours to ~1 hour.

Analyst Intern | Greenway Solutions (USAA)

May – Sep 2016

- Benchmarked USAA fraud controls across online, mobile, and call-center channels versus 9 peer U.S. banks; delivered recommendations on funds-availability, wire-transfer, and identity-verification controls.

SELECTED RESEARCH

- **Minimum Viable Equivalence Packs.** *SSRN*. Three equivalence claims (legal, operational, economic) tested through nine diligence categories for institutional tokenized-product approval.
- **Tokenized Equity.** *Published*. Diligence framework for tokenized equity: rights parity, custody segregation, settlement dependencies, and market-structure constraints.
- **Routing the Dollar.** *Submitted, Fed Reserve Board / FRBNY, June 2026. SSRN*. Gateway concentration, settlement flows, and dollar transmission for institutional tokenized-cash products.
- **Dollar v3 / The Control Layer War.** *Published*. How different token types inherit different regulatory perimeters and value-capture mechanics.

TECHNICAL

Methods: Scenario analysis, time-series econometrics (cointegration, vector error correction), Monte Carlo simulation, concentration and liquidity analysis

Data: Dune Analytics, Nansen Pro, Artemis, DefiLlama, FRED, CoinGecko, Helius, SEC filing and press-release monitoring

Languages: Python (pandas, statsmodels, scipy, matplotlib), SQL (DuneSQL, Trino), JavaScript/TypeScript, Excel

Infrastructure: 10 custom Python MCP servers for real-time data feeds, Claude Code, Cursor, n8n, Apify, Git/GitHub

EDUCATION

High Point University | B.S.B.A., Business Administration (Magna Cum Laude)
Investment Club President | Lingnan University, Hong Kong (Exchange)

2018
